

Lys, armaturer, LED

Å skaffe til veie dokumenter som eks. brukermanual, liste over kritiske komponenter, tekniske tegninger osv. er en del av prosessen med å få et belysningsprodukt testet og deretter evt. sertifisert. I listen under finner du de vanligste dokumentene som må være på plass før prosessen kan påstartes.

- User/Instruction Manual
- Schematics (.pdf format)
- Circuit board trace layouts if used.
- If PCB/PWB is used, the layout with and without components is required (.pdf format)
- Input Power Rating (e.g. 100-240VAC, 50/60Hz, 3.5A max)
- Copy / Drawings of labels.
- Model list that covers:
 - Type designation
 - Ratings like supply voltage, power/current consumption, electric class, IP class, lite source type/definition and ratings, special properties
 - Common properties and differences between models
 - List of spare parts and/or accessories
- Agency report for LEDs to IEC 62471 if applicable.
- Bill of materials covering ALL used components and materials.
- Creation of a detailed List of Critical Components, including manufacturer, part#, ratings and agency certifications (Critical Components are defined as all components in Mains, enclosure and secondary circuit components that may be relied upon to prevent a safety hazard)**. Remember to include the alternative components.
- List of ALL production facilities/factories, including information about which model is produced at which factory. If one model is produced on more than one production sites, a declaration of product identity by manufacturer is needed (similar to what is described in IEC 02 clause 4.2.5 described).
- Declarations of identity and authorization letters for OEM/Co-licensing

Våre testingeniører kan gjennomføre en dokumentevaluering slik at du kan være trygg på at du har det du trenger før testing. Dette vil spare deg for mye tid senere i prosessen.
